Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

Functions setjmp and longjmp

Included into the C language:

```
#include <setjmp.h>
```

```
int setjmp(jmp_buf env) ;
void longjmp(jmp_buf env, int val) ;
```

setjmp(env) memoizes the current environment into the env variable and returns 0. longjmp(env,val) starts over from the return point where env was saved, but the returned value at this point is now val Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

If you write something like:

if (setjmp(env)) ; else ; **0**

that allows you to start a computation at $\mathbf{0}$; if you want to *escape* it, use:

longjmp(env,1)

and the computation will terminate by running \mathbf{Q} , getting rid of $\mathbf{0}$.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

If you write something like:

that allows you to start a computation at $\mathbf{0}$; if you want to *escape* it, use:

longjmp(env,1)

and the computation will terminate by running \boldsymbol{Q} , getting rid of $\boldsymbol{0}$.

A kind of goto, but to a place already reached,

<ロト < 昂ト < 言ト < 言 > 言 の Q () 7/4/16

If you write something like:

that allows you to start a computation at $\mathbf{0}$; if you want to *escape* it, use:

longjmp(env,1)

and the computation will terminate by running \mathbf{Q} , getting rid of $\mathbf{0}$.

A kind of *goto*, but to a place already reached, or a kind of *backtrack*.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

If you write something like:

if (setjmp(env)) ; else ; **2 0**

that allows you to start a computation at $\mathbf{0}$; if you want to *escape* it, use:

longjmp(env,1)

and the computation will terminate by running \boldsymbol{Q} , getting rid of $\boldsymbol{0}$.

A kind of *goto*, but to a place already reached, or a kind of *backtrack*.

These functions have been used to implement a rough mechanism of *exceptions* but, in reality, they are closed to *continuations*.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

$$(F_1 \text{ (call/cc } G_1)) \equiv (F_1 \text{ (} G_1 \quad \overleftarrow{-} F_1))$$

If F_1 is invoked within G_1 's body, it is applied and yields a *direct* result, without returning to a caller.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

$$(F_1 \text{ (call/cc } G_1)) \equiv (F_1 \text{ (} G_1 \leftrightarrow F_1))$$

If F_1 is invoked within G_1 's body, it is applied and yields a *direct* result, without returning to a caller. ' $(F_1 \ldots)$ ' is for 'normal' run.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

 $(F_1 \text{ (call/cc } G_1)) \equiv (F_1 \text{ (} G_1 \quad \overleftarrow{-} F_1))$

If F_1 is invoked within G_1 's body, it is applied and yields a *direct* result, without returning to a caller. ' $(F_1 \ldots)$ ' is for 'normal' run.

Examples:

(+ 1 (call/cc (lambda (f1) (* 2 (f1 2023)))) \Longrightarrow 2024

(+ 1 (call/cc (lambda (f1) (* 2 2023)))) \implies 4047

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

 $(F_1 \text{ (call/cc } G_1)) \equiv (F_1 \text{ (} G_1 \quad \overleftarrow{-} F_1))$

If F_1 is invoked within G_1 's body, it is applied and yields a *direct* result, without returning to a caller. ' $(F_1 \ldots)$ ' is for 'normal' run. Examples:

(+ 1 (call/cc (lambda (f1) (* 2 (f1 2023))))) ⇒ 2024 (+ 1 (call/cc (lambda (f1) (* 2 2023)))) ⇒ 4047

Continuations captured by means of the call/cc function may be saved and applied *overwhelmingly*, but we are not interested in this feature.

Implementing Escape Continuations in C

> Jean-Michel Hufflen

Plan

Motivation

Continuation semantics

Examples

Bridge Scheme/C

$$(F_1 \text{ (call/cc } G_1)) \equiv (F_1 \text{ (} G_1 \quad \overleftarrow{-} F_1))$$

If F_1 is invoked within G_1 's body, it is applied and yields a *direct* result, without returning to a caller. ' $(F_1 \ldots)$ ' is for 'normal' run. Examples:

(+ 1 (call/cc (lambda (f1) (* 2 (f1 2023))))) ⇒ 2024 (+ 1 (call/cc (lambda (f1) (* 2 2023)))) ⇒ 4047

Continuations captured by means of the call/cc function may be saved and applied *overwhelmingly*, but we are not interested in this feature.

call/ec *escape* continuations, dynamic extent only.
